New opsi release 4.0 faster and more robust

**Open source client management system now with database backend and
hierarchical client groups.**

The German open source service provider uib gmbh releases a new version of its client
management system opsi (open pc server integration).
opsi is a Client Management System for Windows clients based on Linux servers.

opsi integrates automatic deployment of Windows operating systems, automatic
installation of software products and updates, license management as well as a hard-
and software inventory.

The new opsi release focuses on stability and performance to meet the needs of large
installations. Also there are enhanced possibilities to manage 64 Bit Clients. Beside these
Highlights there is a large bundle of new features, which ease the daily administration
business.

The core of opsi is distributed as open source without any license fees or subscriptions.
The development of new features like database backend and hierarchical client groups is

cooperatively funded. Until the cooperative funding of a new feature is completed, the new feature is available to paying customers only. Afterwards it will be part of the free open source release.

The easy to use graphical Management Interface is localized in English, German, French, Spanish, Dutch and Turkish.

Besides the opsi development 'uib gmbh' also provides workshops, training and support for opsi.

About uib:
The company uib gmbh was founded in 1995 in Mainz, Germany, with a focus on IT Service Management. uib uses open source software where ever possible and releases most of their own products as open source. It mainly focuses on providing services in the sector of system management. Over the last years the client management system opsi was developed and released later as open source. The opsi customers are small and middle sized companies as wells as public administrations.
